### **DETAILED ACTION**

#### Election/Restrictions

1. Applicant's election with traverse of species I (claims 1-8) in the reply filed on 1/13/2005 is acknowledged. The traversal is on the ground(s) that the search for species II-V would be co-extensive. This is not found persuasive because the species II-V would be classified in a different class than claims 1-8.

The requirement is still deemed proper and is therefore made FINAL.

## Claim Rejections - 35 USC § 103

- 2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

3. Claims 1 and 6-7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Shimada et al. (US 6,504,705) in view of Tadanobu et al. (US 6,680,841).

Regarding claim 1, Shimada et al. disclose an electrolytic capacitor (figure 8) comprising:

- a valve metal (510 element for an anode including a capacitor forming part and an electrode lead part (51A);
- a dielectric oxide film (52) provided on a surface of the valve metal element for an anode;
- a solid electrolyte layer (53) provided on the dielectric oxide film; and
- a charge collecting element/carbon layer (54) and Ag paste layer (55) for a cathode provided on the solid electrolyte layer.

Shimada et al. fail to disclose at least one through hole is formed in the electrode lead part of the valve metal element for an anode to expose core of the valve metal element outside.

Tadanobu et al. teach an anode member (19) joined to anode lead frame (22) by resistance welding via through hole (21).

It would have been obvious to one having ordinary skill in the art at the time the invention was made to use the through hole anode lead of Tadanobu et al. in Shimada, in order to prevents the contamination from occurring, and low leakage current to be produced.

Regarding claim 6, Shimada et al. disclose at least one electrically conductive particle (56) contact with the core of the valve metal element for an anode in the electrode lead part of the valve metal element for an anode (figure 8).

Regarding claim 7, Shimada et al. further disclose at least a part of the electrically conductive particle is coated with a thermosetting resin (column 20, lines 32-36).

## Allowable Subject Matter

4. Claims 2-5 and 8 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

With respect to claims 2-3, the prior art alone or in combination does not teach the limitation of the through hole is filled with an electrically conductive resin composition containing metal powder and a thermosetting resin, and the resin composition is connected to the core of the valve metal element.

With respect to claims 4-5, the prior art alone or in combination does not teach the limitation of a single electrically conductive particle or a single electrically conductive fiber is disposed within the through hole and the particle or fiber contacts with at least a part of the core of the valve metal element in the through hole.

With respect to claim 8, the prior art alone or in combination does not teach the limitation of an electrically conductive resin composition containing metal powder and a thermosetting resin is applied to a surface of the electrode lead part of the valve metal element for an anode.

#### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Nguyen T. Ha whose telephone number is 571-272-

Application/Control Number: 10/726,675 Page 5

Art Unit: 2831

1974. The examiner can normally be reached on Monday-Friday from 8:30AM to 6:00PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Dean Reichard can be reached on 571-272-2800 ext. 31. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
